## Activity 1. Two algorithms with the same complexity

| N    | Loop2(t) | Loop3(t) | Loop2(t)/Loop3(t) |
|------|----------|----------|-------------------|
| 8    | 2        | 1        | 2                 |
| 16   | 3        | 2        | 1.5               |
| 32   | 10       | 5        | 2                 |
| 64   | 40       | 21       | 1.9047            |
| 128  | 159      | 82       | 1.9390            |
| 256  | 630      | 314      | 2.006369          |
| 512  | 2579     | 1275     | 2.02274           |
| 1024 | 10140    | 5103     | 1.98706           |
| 2048 | 40954    | 20280    | 2.01942           |
| 4096 | 164210   | 81386    | 2.01766           |
| ...  | ...      | ...      | Tends to 2        |

(1000 repetitions)

The results make sense as Loop2 has a  $O(n^2)$  complexity and so does Loop3, with the difference that Loop2 is  $2N^2$  and the other just  $N^2$ , so that difference is reflected in the division, tending to 2 as  $N$  increases.

## Activity 2. Two algorithms with different complexity

| N   | Loop1(t) | Loop2(t) | Loop1(t)/Loop2(t) |
|-----|----------|----------|-------------------|
| 8   | 1        | 2        | 0.5               |
| 16  | 1        | 3        | 0.333             |
| 32  | 2        | 10       | 0.2               |
| 64  | 5        | 40       | 0.125             |
| 128 | 10       | 159      | 0.06289           |
| 256 | 23       | 630      | 0.03650           |

| Algorithmics | Student information        | Date     | Number of session |
|--------------|----------------------------|----------|-------------------|
|              | UO: 282650                 | 20/02/23 | 1.2               |
|              | Surname: Fernández Noriega |          |                   |
|              | Name: Christian            |          |                   |

|      |     |        |            |
|------|-----|--------|------------|
| 512  | 52  | 2579   | 0.02162    |
| 1024 | 110 | 10140  | 0.01084    |
| 2048 | 238 | 40954  | 0.005811   |
| 4096 | 523 | 164210 | 0.003184   |
| ...  | ... | ...    | Tends to 0 |

(1000 repetitions)

The results make sense, as the complexity of Loop1 is  $O(n \log n)$  and for Loop2 it is  $O(n^2)$ , which is larger, so the division tends to 0 as N increases.

## Activity 3. Complexity of other algorithms

| N    | Loop4(t) | Loop5(t) | Loop4(t)/Loop5(t) |
|------|----------|----------|-------------------|
| 8    | 1        | 0        | -                 |
| 16   | 3        | 1        | 3                 |
| 32   | 13       | 4        | 3.25              |
| 64   | 162      | 20       | 8.1               |
| 128  | 2616     | 163      | 16.049            |
| 256  | 41600    | 1457     | 28.5518           |
| 512  | 663169   | 13015    | 50.9542           |
| 1024 | ...      | 112701   | ...               |
| ...  | ...      | ...      | Tends to infinity |

(1 repetition)

The results make sense as Loop4 has a  $O(n^4)$  complexity and Loop5's is  $O((\log n)n^3)$ , which is smaller, so the division tends to infinity as N increases.

## Activity 4. Study of unknown.java

| N | Unknown |
|---|---------|
| 8 | 1       |

| Algorithmics | Student information        | Date     | Number of session |
|--------------|----------------------------|----------|-------------------|
|              | UO: 282650                 | 20/02/23 | 1.2               |
|              | Surname: Fernández Noriega |          |                   |
|              | Name: Christian            |          |                   |

|      |        |
|------|--------|
| 16   | 1      |
| 32   | 4      |
| 64   | 26     |
| 128  | 182    |
| 256  | 1115   |
| 512  | 7519   |
| 1024 | 55979  |
| 2048 | 413464 |

(1000 repetitions (microseconds))

The complexity is  $O(n^3)$ , which is reflected on the table

For example, if we know that  $N=512$  takes 7519 microseconds, to calculate the time for  $N=1024$  considering this is a  $O(n^3)$  complexity, would be: 60152, which is somewhat close to the real value in this case
